

Reduce Your Tanker's Contribution to Community Noise

Air & Gas Industries now perform acoustic testing as standard on all newly constructed LPG Road Tankers and Liquid Waste Road Tankers to ensure that external noise levels generated by various pumping operations are within the requirements of the Australian Design Rules.

★ Road Tankers designed and built by Air & Gas Industries are tested for low noise in line with the requirements for external noise as specified in Australian Design Rule 28/01 and the Queensland Government Environmental Protection (Noise) Policy 2008.

★ All acoustic testing is performed by a high precision data logger sound level meter conforming to IEC651

The tests conducted give a quantitative measure of the noise produced by various Tanker operations and include pumping and engine conditions.
